DETAILED ACTION

Claim Objections

Claims 2, 6 are objected to because of the following informalities:

-In claim 2, line 2, --at least one of-- should be inserted after “is” and “and/or” should be changed to --and--.

-In claim 6, lines 5, 7 --at least one of-- should be inserted after “determining” and “and/or” should be changed to --and--. Appropriate corrections are required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-10 are rejected under 35 U.S.C. 102(b) as being anticipated by Bush et al. (US patent 5,842,340).

Regarding claims 1, 2, 6, 7, Bush discloses an exhaust system for an internal combustion engine on a vehicle, having an exhaust catalytic converter and having a probe assembly in the area of the exhaust catalytic converter as a component of a lambda control device by means of which the internal combustion engine may be switched alternately between a lean-fuel operating range and a rich-fuel operating range, as a function of the probe signals detected by means of the probe assembly, wherein characterized in that the probe assembly is in the form of a single lambda probe delivering a constant probe signal, such lambda probe (30) being mounted

downstream from the exhaust catalytic converter (34) and by means of which, in conjunction with the lambda control device, the increase in the amount of oxygen in the exhaust gas flow is determined over the entire period of the lean-fuel operating phase and the decrease in the amount of oxygen in the exhaust gas flow is determined over the entire period of the rich-fuel operating phase, in relation to a specified oxygen amount reference value, an oxygen-dependent threshold switching value being specified which, when reached, causes switching of the lambda control device to the respective other area of operation (see Figure 1, col. 3, lines 28-46, col. 10, lines 46-67, col. 11, lines 1+).

Regarding claims 3, 8, Bush further discloses that the threshold switching value is in the form of the gradients of increase or decrease in the oxygen of the exhaust downstream from the catalytic converter (see col. 3, lines 28-36).

Regarding claims 4, 9, Bush further discloses that threshold switching value is entered in a performance graph of an engine control device (see col. 3, lines 36-46).

Regarding claims 5, 10, Bush further discloses that the oxygen amount reference value is in each instance in the form of the preceding threshold switching value (see col. 3, lines 28-45).
